sage Accpac

Dear Customers,

Have you ever wonder how much more savings you can gain by enhancing your system beyond ERP?

With the correct framework, ERP systems can now be quickly enhanced with enterprise intelligence.

Streamlining data integration techniques with appropriate tools can quickly translate the complex transactional world of ERP into the business domain that end users need to monitor, measure and manage their business.

Ever thought about enhancing your favorite Microsoft Excel for easy and affordable business intelligence reporting?

Check out Alchemex's Business Intel **ligence** reporting software...

It promises to deliver automated and pre-formatted management packs and other decision-support reports on demand in Excel directly from the database of a company's accounting system

What's more?

Alchemex OLAP (On Line Analytical Processing) technology supports multi-dimensional analysis extracting high volumes of information from multiple data sources or data warehouses with pre-built CUBE definitions as well as creating new ones.

So why is OLAP valuable?

- OLAP can provide insight into a company's business that other business applications cannot. ERP can provide transactional elements or customer details but it cannot yet rank customers in order of importance, segment suppliers according to order-fill parameters, or identify trends.
- OLAP is flexible; OLAP tools provide an easy way to analyze data by

Keep control of your project cost, billing and account receivables, even when you need to bill multiple customers for the same job

Complete all your projects on time and within budget

The key to this is an efficient job costing tool.....

simply dragging and dropping dimensions and facts into the appropriate locations.

- OLAP takes it a step further by answering the “what if” and “why” questions. The OLAP module enables decision-making about future actions, which is typically more complex than simply summoning data.
- OLAP is useful in helping to determine why data appears the way it does. By progressively expanding portions of levels within a dimension, it is possible to drill-down into progressively more detail, to spot a trend or a problem. OLAP tools also allow a breakdown structure of the data where a single piece of data can be dissected into a series of levels to identify something interesting.
- OLAP empowers you to analyse data in your database that is not stored in a suitable format to achieve the type of analysis you have required, prior to OLAP making it possible.

End of the day, **How Much Can You Save?**

Project and Job Costing

Top reasons to use **Project Job Costing**:

- **Flexible selection of accounting method** (revenue recognition method) for each project within the contract
- Close a project to **billings and/or costs** at any time
- **Drill down** to the originating transactions
- Assign staff, material, subcontractors, equipment, miscellaneous items, and overhead to each project **within the contract**
- Do **multiple customer billing**, invoicing multiple parties to one contract for different facets of work
- **Set up complex estimates by specifying the quantity**
- **And many more!!!!**
